

MOUNTAINS OF THE MOON UNIVERSITY
FACULTY OF SCIENCE TECHNOLOGY AND
INNOVATION
COMPUTER LITERACY
BCS1101
SEMESTER1 YR 1

GROUP SIX

1. ATWONGERE VIANNEY
2. BWAMBALE FRANKLINE GIFT
3. BONALD STEPHEN
4. BANGIRANA DOUGLAS
5. MUGARURA ALBERT
6. ITAAGI DAVIS
7. KEBIRUNGI CAROLYNE
8. MURUNGI WILSON.

QN 1.WHAT DO YOU UNDERSTAND BY THE TERM CYBER SECURITY?

Cyber security is the practice or process of protecting computer devices, information or a network from malicious attacks like hacking phishing, spamming e. t. c

Cyber security is the application of the technologies, processes, and controls to protect systems, networks , programs, devices and data from cyber attacks.

Cyber security is the act of protecting computer systems , networks and from theft, damage, or unauthorized access.

Cyber security is the defending of computers servers, mobile devices, electronic systems , networks and data from malicious attacks.

NB: CYBER SECURITY IS ALSO KNOWN AS ELECTRONIC INFORMATION SECURITY/INFORMATION TECHNOLOGY SECURITY.

QN 2.STATE AND BRIEFLY EXPLAIN THE TYPES OF SECURITY

1. Physical security. This involves the protection of people, property and assets from any physical harm or theft. It includes security guards surveillance cameras etc.

2. Cyber security. This is the protection of computer networks from unauthorized access, use and disruption. It includes things like firewall, data encryption.

- Application security. involves securing software applications and their code to prevent vulnerabilities and breaches
- Network security. This focuses on protecting an organizations network infrastructure from unauthorized access
- Information security. This is concerned with safe guarding sensitivity data and ensuring confidentiality.
- Cloud security. This involves ensuring that data and applications hosted in the cloud are secure.
- Authentication .this ensures that users and entities are who they claim to be before granting access
- Authorization. This determines what action and resources users or systems are allowed to access once they have been authenticated.
- Supply chain security. This involves protecting the integrity of products and components throughout the supply chain to prevent tampering of items.

QN 3.WHY BACKUP AND RECOVERY MANAGEMENT IS CONSIDERED AS A VERY IMPORTANT SECURITY MEASURE?

- ❖ Back up is a copy of data that can be recovered in the event of primary data failures caused by hardware or software failures, data corruption, accidental deletion.
- ❖ Restore is the retrieval of data from a cloud server/storage media or another computer.
- It ensures the protection and preservation of critical data and information .
- It minimizes the risk of data loss due hardware failures ,system crashes, natural disasters e.t.c
- It protects the organizations operations
- Ensures business continuity by quickly restoring systems and data ,reducing downtime and financial losses.
- It enables organizations to comply with the set regulations e.g general data protection regulation.
- It saves money or organizational operational costs since missing data is costly to regain.
- It enables organization gain customer trust through demonstrating a commitment data protection and recovery enhances customers trust.

- Ensures redundancy and fault tolerance, most backup systems often involve redundant storage and infrastructure which serves as a fault tolerant hence ensuring that remains accessible even If primary systems fail.

QN 4.DISCUSS WHY INFORMATION SECURITY IS A NECCESITY IN AN ORGANIZATION OR COMPANY?

Information security is the process of maintaining confidentiality, ensuring integrity and assuring availability of information (both in storage and transit).

- It protects sensitive data since organizations store vast amounts of data information security safe guards the data from any form of unauthorized access.
- It acts as a form of legal and regulatory compliance, most organizations have strict regulations governing data such as CCPA,GDPR,HIPAA.(reduces the risk of legal compliance)
- Prevents unauthorized disclosure of company's information which may result in to negative financial impacts and reputational impacts.
- It promotes business continuity since all the vital business information is secure

- Reduces the risk of internal and external attacks on the company's information.
