

HTML BASICS

What tools will we use?

We will use a text editor to write our code and a browser to test

Examples of Text Editors:

Notepad

Notepad ++

Textwrangl
ublime

etc

What is HTML?

HTML is a **markup** language for **describing** web documents (web pages).

HTML stands for **H**yper **T**ext **M**arkup Language

A markup language is a set of **markup tags**

HTML documents are described by **HTML tags**

Each HTML tag **describes** different document content

Introduction to Versions of Html

We are mostly aware of websites. A website is simply a collection of web pages. For creating any web page, we require HTML.

An HTML is the element that is responsible for making any web page.

HTML stands for Hypertext Markup Language. It is a basic markup language used to make any web pages that further comprise to form websites.

HTML had evolved so much from the initial stage when it was formed.

Let us know about the history of HTML.

The first version of HTML was written by **Tim Berners-Lee** in 1993. Since then, there have been many different versions of HTML.

The most widely used version throughout the 2000's was HTML 4.01, which became an official standard in December 1999.

HTML 1.0

- The basic version of HTML has support for basic elements like text controls and images.
- This was the very basic version of HTML with less support for a wide range of HTML elements. It does not have rich features like styling and other things that were related to how content will be rendered in a browser.
- The initial version of HTML does not provide support for tables, font support, etc., as it provides us in the latest version.
- We would also like to discuss that W3C did not exist before HTML 2.0; hence it does not show details about HTML 1.

HTML 2

- HTML version 2.0 was developed in 1995 with basic intention of improving HTML version 1.0
- Now a standard got started to develop so as to maintain common rules and regulations across different browsers.
- HTML 2.0 has improved a lot in terms of the markup tags.
- In HTML 2.0 version concept of form came into force. Forms were developed, but still, they had basic tags like text boxes, buttons, etc.
- Also, the table came as an HTML tag. Now, in HTML tag 2.0, browsers also came with the concept of creating their own layers of tags that were specific to the browser itself.

HTML 3.2

- It was developed in 1997. After HTML 2.0 was developed, the next version of HTML was 3.2
- With version 3.2 of HTML, HTML tags were further improved. It is worth noting that because of W3C standard maintenance, the newer version of HTML was 3.2 instead of 3.
- Now, HTML 3.2 has better support for new form elements. Another important feature what HTML 3.2 implemented was support for CSS. CSS stands for Cascading Style Sheet. It is CSS that provides features to make HTML tags look better on rendering it on browsers. CSS helps to style HTML elements.
- With the upgradation of browsers to HTML 3.2, the browser also supported for frame tags, although HTML specifications still do not support frame markup tags.

HTML 4.01

- It was developed in 1999. It extended the support of cascading styling sheets. In version 3.2, CSS were embedded in HTML page itself. Therefore, if the website has various web pages to apply to the style of each page, we must place CSS on each web page. Hence there was a repetition of the same block of CSS.
- To overcome this thing, in version 4.01 concept of an external styling sheet emerged. Under this concept, an external CSS file could be developed, and this external styling file could be included in HTML itself.
- HTML 4.01 provided support for further new tags of HTML.

HTML5

- This is the latest version of HTML.
- For a developer, It came up with lots of HTML tags support.
- HTML5 provided support for new form elements like input elements of different types; geolocations support tags, etc.

Let us look at a few of the tags which were added to HTML5

- **Email** – New HTML5 tag, which was added, is the input element of type email. This is a form tag, although it could be used outside of a form tag also. This tag checks the validation of the input value. It checks whether the value inserted is a valid email.
- **Password** – This is another form tag that was added to receive a password from the user. Being the password type field, the user types in the field are not visible directly to the user but are represented by special symbols. These symbols save the password from getting revealed on the browser.
- **Audio tag** – This is a new audio tag that was implemented in [HTML5](#). This tag helps to add audio to our web page. We can use this tag to embed an audio clip into a web page. This audio tag could be played on a webpage.

Let us look at a few of the tags which were added to HTML5

- **Semantic tags** – Semantic tags are also known as structural tags. Structural tags are the tags that provide structure to the HTML page. It helps it divide the HTML page into different structures.
- These structures get combined into an HTML page itself to form an HTML web page. Few of the important HTML semantic tags are figcaption, <header>, <footer>
- **Section tag** – This tag is used to semantic a section in an HTML page. A section tag represents a section on a web page.

HTML

HTML stands for **Hyper Text Markup Language**

Describes the **structure** of Web pages

Elements are the building blocks of HTML pages and are represented by **tags**

HTML tags label pieces of content such as "heading", "paragraph", "table", and so on

Browsers do not display the HTML tags, but use them to render the content of the page

<tagname>Some Content in here....</tagname>

Defines the type of element

The stuff that gets displayed

Close off the element

HTML Tags

HTML tags are **keywords** (tag names) surrounded by **angle brackets**:

`<tagname>content</tagname>`

HTML tags normally come in **pairs** like `<p>` and `</p>`

The first tag in a pair is the **start tag**, the second tag is the **end tag**

The end tag is written like the start tag, but with a **slash** before the tag name

The start tag is often called the **opening tag**. The end tag is often called the **closing tag**.

opening tag closing tag

<p>paragraph</p>

HTML Element

The diagram shows the HTML code for a paragraph element: `<p>paragraph</p>`. The opening tag `<p>` is highlighted in red, and the closing tag `</p>` is also highlighted in red. A horizontal line spans the entire code, with a vertical line extending from its center down to the text "HTML Element". Above the opening tag, the text "opening tag" is written, and above the closing tag, the text "closing tag" is written. Both are connected to their respective tags by thin vertical lines.

Start Tag *Content* *End Tag*

<h1>Heading Content</h1>

h1 Element

The diagram shows the HTML code for a heading element: `<h1>Heading Content</h1>`. The opening tag `<h1>` is highlighted in red, and the closing tag `</h1>` is also highlighted in red. A horizontal line spans the entire code, with a vertical line extending from its center down to the text "*h1 Element*". Above the opening tag, the text "*Start Tag*" is written, and above the closing tag, the text "*End Tag*" is written. Both are connected to their respective tags by thin vertical lines. The word "Content" is written above the text "Heading Content". A large green curly bracket is positioned below the entire code, spanning from the opening tag to the closing tag.

Syntax of HTML

`<html>`

`<head>`

`<title>SS</title>`

`</head>`

`<body>`

html Codes/tags In Here

`</body>`

`</html>`

Example

<html>

<head>

<title>Hello World</title>

</head>

<body>

<h1>My First page at MMU</h1>

<p>My first Page at MMU</p>

</body>

</html>

HTML

```
<!DOCTYPE html>
<html>
<head>
<title>Page Title</title>
</head>
<body>

<h1>My First Heading</h1>
<p>My first paragraph.</p>

</body>
</html>
```

My First Heading

My first paragraph.

Example Explained

The text between `<html>` and `</html>` describes an HTML document

The text between `<head>` and `</head>` provides information about the document

The text between `<title>` and `</title>` provides a title for the document

The text between `<body>` and `</body>` describes the visible page content

The text between `<h1>` and `</h1>` describes a heading

The text between `<p>` and `</p>` describes a paragraph

Where do I save my Files or pages?

Computer

yourUsername

Save the HTML Page

Steps 1: You need a folder to work with, create a folder

Steps 2: Open Notepad or any editor;

Save the file on your computer in the folder you created earlier

Select **File > Save as** in the Notepad or editor menu.

Name the file "**index.html**" or any other name ending with **.html** extension or the preferred encoding for HTML files.

How do I see my website?

<http://cs1.ucc.ie/~yourUsername>

How do I test my Code/Scripts?

Right Click your .html file

Open with.... (a browser)

OR

Upload to public_html and visit your website:

<http://cs1.ucc.ie/~yourUsername>

Browsers

** + many more lesser known and developed

View HTML Page

View HTML Page in Your Browser

Open the saved HTML file in your favorite browser. The result will look much like this:

To open a file in a browser, double click on the file, or right-click, and choose open with
