

DCS 2101 - Fundamental of Web Design

Working with Graphics in HTML

Images & Multimedia Files

Why Multimedia

- Multimedia comes in many different formats. It can be almost anything you can hear or see, like images, music, sound, videos, records, films, animations and more.
- Web pages often contain multimedia elements of different types and format
- Images are very important to beautify as well as to depict many complex concepts in simple way on your web page.
- Images can improve the design and the appearance of a web page.

Omumbejja By Nince Henry & Zaake

HTML Favicon

- A favicon is a small image displayed next to the page title in the browser tab.
- A favicon image is displayed to the left of the page title in the browser tab, like this:

How To Add a Favicon in HTML

To add a favicon to your website, either save your favicon image to the root directory of your webserver, or create a folder in the root directory called images, and save your favicon image in this folder. A common name for a favicon image is "favicon.ico".

Next, add a `<link>` element to your "index.html" file, after the `<title>` element

```
<head>  
    <title>Set Image Width and Height</title>  
<link rel="shortcut icon" type="image/jpg" href="pics/mmu1.jpg"/>  
</head>
```

HTML Images Syntax

**The HTML ** tag is used to embed an image in a web page.

Images are not technically inserted into a web page; images are linked to web pages.

The tag creates a holding space for the referenced image.

**The ** tag is empty, it contains attributes only, and does not have a closing tag.

**The ** tag has two required attributes:

- src** - Specifies the path to the image
- alt** - Specifies an alternate text for the image

The src Attribute

The required src attribute specifies the path (URL) to the image.

Note: When a web page loads, it is the browser, at that moment, that gets the image from a web server and inserts it into the page. Therefore, make sure that the image actually stays in the same spot in relation to the web page, otherwise your visitors will get a broken link icon. The broken link icon and the alt text are shown if the browser cannot find the image

```

```

Image Size - Width and Height

- You can set image width and height based on your requirement using **width** and **height** attributes. You can specify width and height of the image in terms of either pixels or percentage of its actual size

```
<html>

  <head>
    <title>Set Image Width and Height</title>
  </head>

  <body>
    <p>Setting image width and height</p>
    <img src = "/html/images/mmulogo.png" alt = "Test Image" width = "150" height = "100"/>
  </body>

</html>
```

You can use the **style** attribute to specify the **width** and **height** of an image.

```
<html>
  <head>
    <title>Set Image Width and Height</title>
  </head>

  <body>
    
  </body>

</html>
```

Set Image Border

- By default, image will have a border around it, you can specify border thickness in terms of pixels using border attribute.
- A thickness of 0 means, no border around the picture.

```
<html>
  <head>
    <title>Set Image Width and Height</title>
  </head>

  <body>
    
  </body>
</html>
```

Set Image Alignment and Floating

- By default, image will align at the left side of the page, but you can use **align** attribute to set it in the center or right.
- you can also use the CSS float property to let the image float to the right or to the left of a text:

```
  
  
<br>  

```

HTML Multimedia

- Multimedia on the web is sound, music, videos, movies, and animations.

Multimedia Formats

- Multimedia elements (like audio or video) are stored in media files.
- The most common way to discover the type of a file, is to look at the file extension.
- Multimedia files have formats and different extensions like: .wav, .mp3, .mp4, .mpg, .wmv, and .avi

HTML Video

- The HTML `<video>` element is used to show a video on a web page.
- To show a video in HTML, use the `<video>` element:

```
<video width="320" height="240" controls>  
  <source src="IoT.mp4" type="video/mp4">  
</video>
```

How it Works

- The **controls** attribute adds video controls, like play, pause, and volume.
- It is a good idea to always include **width** and **height** attributes. If height and width are not set, the page might flicker while the video loads.
- The **<source>** element allows you to specify alternative video files which the browser may choose from.
- The browser will use the first recognized format.
- The text between the **<video>** and **</video>** tags will only be displayed in browsers that do not support the **<video>** element.

HTML Audio

- The HTML `<audio>` element is used to play an audio file on a web page.

The HTML `<audio>` Element

To play an audio file in HTML, use the `<audio>` element

```
<audio controls>  
  <source src="An-Known.mp3" type="audio/mpeg">  
</audio>
```

HTML **Audio** - How It Works

The **controls** attribute adds audio controls, like play, pause, and volume.

The **<source>** element allows you to specify alternative audio files which the browser may choose from.

The browser will use the first recognized format.

The text between the **<audio>** and **</audio>** tags will only be displayed in browsers that do not support the **<audio>** element.

Playing a YouTube Video in HTML

To play your video on a web page, do the following:

- Upload the video to YouTube
- Take a note of the video id
- Define an `<iframe>` element in your web page
- Let the `src` attribute point to the video URL
- Use the `width` and `height` attributes to specify the dimension of the player
- Add any other parameters to the URL

```
<iframe width="420" height="315"  
src="https://www.youtube.com/embed/tgbNymZ7vqY">  
</iframe>
```
