

Simple Logistic Regression

February 28, 2024

LOGISTIC REGRESSION

```
[1]: #STEPS  
    #1) Import necessary Libraries  
    #2) Getting data  
    #3) Creating a model and training it  
    #4) Evaluating the Model
```

```
[3]: #1) Import necessary Libraries  
import numpy as np  
from sklearn.linear_model import LogisticRegression
```

```
[6]: #2) Getting data  
x = np.arange(10).reshape(-1,1)
```

```
[7]: x
```

```
[7]: array([[0],  
          [1],  
          [2],  
          [3],  
          [4],  
          [5],  
          [6],  
          [7],  
          [8],  
          [9]])
```

```
[8]: y = np.array([0,1,0,0,1,1,1,1,1,1])  
y
```

```
[8]: array([0, 1, 0, 0, 1, 1, 1, 1, 1, 1])
```

```
[10]: #Build Model and fit it  
model = LogisticRegression().fit(x,y)
```

```
[11]: score = model.score(x,y)
```

```
[12]: score
```

```
[12]: 0.8
```

```
[13]: y_pred = model.predict(x)  
      y_pred
```

```
[13]: array([0, 0, 0, 1, 1, 1, 1, 1, 1, 1])
```
